/lab.host="E. Coli strain XLIO-Gold Tl-resistant, F-"
/note="vector: PWD42nv; Purified genomic DNA from M.
musculus G7BL/GJ (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess: The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWNA2 (gill/372114/191A129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XIIO-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 33 BP; 12 A; 8 C; 8 G; 5 T; 0 other;

coligonucleotides #1 and #2 (see AAV63866) are designed to amplify a portion of a genomic clone encoding the P45 protein (see AAW72847) of Pyrococcus furiosus DSM 3638. They include P45 and vector specific sequences. Oligo #1 includes the ATG start codon and 5° end of the P45 coding region (see also AAV63860). The primers were designed to function with the Stratagene Affinity Protein Expression and Purification System, which uses ligation independent cloning. Recombinant P45 was expressed in E. coli independent cloning. Recombinant P45 was expressed in E. coli independent cloning. Recombinant P45 was expressed in E. coli curlosus DNA polymerase, thereby providing replication products of greater length and purity. A claimed method of enhancing a nucleic acid polymerase reaction involves adding P45 protein to the reaction. A claimed DNA encoding a polymerase encinon involves adding P45 protein C (EEF) may include oligonucleotide #1, or a hybridisable or degenerate variant, and a claimed method for cloning a PEF activity may utilise the complement of oligonucleotide #1.

Polymerase enhancing factor proteins, extracts and complexes - improve the polymerisation activity of nucleic acid polymerases, for use in amplification, sequencing and replication

Claim 84; Page 48; 161pp; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides, or (b) a combination of an oligonucleotide comprises a least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence, where the oligonucleotide which comprises a 1'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the partients and and oligonosis of the primers are also useful for the country of the full-length cDNAs. The primers are also useful for the hall the full-length cDNAs. The primers are also useful for the AMH13633 to AAH13633 to AAH13632 to AAH13632 to AAH13632 to Febresent thuman anno acid sequences; and AAH13632 to AAH13632 to fe the process to the process and the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the process of the p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules (AAH87645-AAH88116) that correspond to all or part of a mRNA molecule expressed in plant oil gland cells, especially peppermint and plant oil glands that produce terpenoid essential oils and resins. The nucleic acids are useful for genetically mapping a plant genome for genes expressed in plant oil gland cells and to suppress (for example by antisense suppression) or enhance their expression (for example by genetically transforming a plant cell with a replicable expression vector that expresses one or more proteins naturally expressed in plant oil gland cells). The nucleic acids are also useful for recombinant expression of plant oil gland proteins required for terpenoid essential oil and/or resin production in bacterial and/or yeast cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; primer, detection; diagnosis; antisense therapy; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid molecules corresponding to mRNA molecules expressed in peppermint oil glands for enhancing expression of plant oil gland cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules (AAH87645-AAH88116) that correspond to all or part of a mRNA molecule expressed in plant oil gland correspond to all or part of a mRNA molecule expressed in plant oil gland cells especially peppermint and plant oil glands that produce terpenoid especially mapping a plant genome for genes expressed in plant oil gland cells and to suppress (for example by antisense suppression) or gland cells and to suppress (for example by antisense suppression) or plant cell with a replicable expression vector that expression one or more proteins naturally expressed in plant oil gland cells). The nucleic acids are also useful for recombinant expression of plant oil gland cells and/or terpenoid essential oil and/or resin production in bacterial and/or yeast cells.
                                                                                                                                                                                                                               New nucleic acid molecules corresponding to mRNA molecules expressed in peppermint oil glands for enhancing expression of plant oil gland cell proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Neutrophil inhibitory factor; NIF; mutant; shock; stroke; allograft rejection; vascullits; autoimmune diabetes; ARDS; rheumatoid arthritis; inflammatory skin disease; myocardial infarction; inflammatory bowel disease; adult respiratory distress syndrome; ischemia reperfusion injury; acute inflammation; bacterial infection; vaccine; parasitic worm infection; antihelminic; ss.

                                                                                                                                                                                                        The specification describes mutant Neutrophil Inhibitory Factors (NIFs), where at least 1 of the Asp residues at positions 18, 87, 110, 130, 137, or 223 in the wild type sequence (see AAY23591) is replaced by a Given to 223 in the wild type sequence (see AAY23591) is replaced by a Given to 233 in the wild type sequence (see AAY23591) is replaced by a Given to 234 in the wild type sequence (see AAY23591) is replaced by a Given to 245 in the material of the sequence (AROS), is the constant of an activities of the sequence (AROS), is the seperation injury following myocardial infarction, and acute inflammation caused by for a parasitic worm as sepsis or bacterial meningities. NIFs or NIF fragments may be used as vaccines against parasitic worm infection and isolation of NIF from tissue homogenates, cloned cells etc. NIFs may a parasitic worm, as antihnelminic agents, and in the detection and isolation of NIF from tissue homogenates, cloned cells etc. NIFs may be useful for the detection of NIF mind. So a rangonists in other compounds. Other NIF agonists and inhibitors may also be used as antihelminic agents. AAX85537-47 encode canine hookworm NIF proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted protein; diagnosis; immunosuppressive; antiarthritic; antirhomatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; ophthalmological; gene therapy; autoimmune disease; neoplasm; hyperproliferative disorder; cancer; cardiovascular disorder; infection; cerebrovascular disorder; anglogenesis; nervous system disorder; conclar disorder; wound healing; skin aging; food additive; preservative;

The polynucleotide sequences given in AAC59738 to AAC59787 encode the human secreted proteins given in AAB34577 to AAB34626. AAB34627 to AAB34626 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Example of activities include: cardiant; vasotropic; cerebroprotective, nootropic; cardiant; vasotropic; cerebroprotective, nootropic; cytostatic; cardiant; vasotropid; or provent, treat or amelorate a medical condition in e.g. humans, mice, prevent, treat or amelorate a medical condition or susceptibility to a pathological condition or susceptibility to a cancers of the breast or liver, cardiovascular disorders, angiogenesis, nervous system disorders, infections caused by bacteria, viruses and fungi and ocular disorders. Infections caused by bacteria, viruses and fungi and ocular disorders. Infections caused by bacteria, viruses and fungi and coular disorders. Corepensation, to prevent skin aging to submurn, to maintain organs before transplantation, for supporting cell culture of primary tissues, coreparative to preservative to increase or decrease storage capabilities. AAC59729 to AAC59739 and AAB34576 represent sequences used in the exemplification of the present invention.
                                                                                                                                       Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition

Homo sapiens

and certs the years are expressed in Examples of activities include:
annunomodulatory; antisclerotic; dermatological; annunosuppressive;
antiinflammatory; antisclerotic; dermatological; mnunosuppressive;
c vascular; anticonvulsant; nootropic; antialzheimers;
antiparkinsonian; and vulnerary. The polynucleotides and polypeptides can
be used in the prevention, diagnosis and treatment of diseases associated
with inappropriate polypeptide expression. Disorders that may be
prevented, diagnosed and/or treated by the above methods include immune
disorders (e.g. multiple sclerosis, systemic lupus erythematosus and
human immuno-deficiency virus (HIV) infections), hyperproliferative
disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases
c e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary
arteriosclerosis), angiogenic disorders (e.g. corneal graft
neovascularisation and diabetic retinopathy), neurological disorders
(e.g. Huntington's chorea, Alzheimer's diseases and Parkinson's diseases),
infectious diseases and/or for promoting wound healing, regeneration and
control of the coronary and ARPSI212 and ARBS(88) represent sequences The polynucleotide sequences given in AAF33213 to AAF33261 encode the human secreted proteins given in AAB64882 to AAB64930. AAB64931 to AAB64991 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: transferase; amylase; Sulfolobus; production; alpha, alpha-trehalose; malto-oligosaccharide; hydrolysis; ss. Nucleic acids encoding 49 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's ô DB 22; Length 1057; 17; Indels Sequence 1057 BP; 238 A; 259 C; 292 G; 268 T; 0 other; used in the exemplification of the present invention. ; DNA encoding Sulfolobus solfataricus amylase. 3.8%; Score 18; DB 100.0%; Pred. The present invention describes primer sets for synthesising 5602

[ull-length CDMsA defined in the specification. Where a primer set

[ull-length CDMsA defined in the specification. Where primer set

[under comprises: (a) an oligo-dr primer and an oligoucleotide comprises one of

the 5602 nucleotide sequences defined in the specification, where the

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprises as 1'-end sequence complementary to a

polynucleotide which comprises a 3'-end sequence where the

oligonucleotide comprises a 1-end sequence which combination of

the 5'-end sequence/3'-end sequence is selected from those defined in

the specification. The primers are useful for synthesising polynucleotides,

particularly full-length combxs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

che full-length cDMAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

CMABS683 represent human annino acid sequences; AAB92446 to

AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to

AAH13632 to AAH13632

cepresent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                            Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention provides the sequences of 184 cDNA fragments which are differentially expressed in cancer cell depending on the age of the patient. They can be used to diagnose and identify treatments for cancers, particularly brain cancers as as a particularly brain cancers as haemangioblastoma, teratoma, haemangiona, glioblastoma, schwannoma, osteoma and pinealoma. The present sequence is a cancer-associated cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid molecules differentially expressed in brain cancers, useful for ascertaining propensity of cell for malignant phenotype or ascertaining suitability of anti-neoplastic drug candidate -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed oligonucleotides as primers in a PCR reaction (see AAQ12788 and AAQ12789). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                             The present invention provides the sequences of 184 cDNA fragments which part of differentially expressed in cancer cell depending on the age of the patient. They can be used to diagnose and identify treatments for cencers, particularly brain cancers such as haemangioblastoma, teratoma, haemangioma, glioblastoma, scheama, osteoma and pinealoma. The present sequence is a cancer-associated cDNA of the invention.
                                                                          Novel nucleic acid molecules differentially expressed in brain cancers, useful for ascertaining propensity of cell for malignant phenotype or ascertaining suitability of anti-neoplastic drug candidate -

The hybrid interferons are useful as antiviral and antitumour agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hybrid alpha/omega interferon; antiviral; virucide; antitumour;

NOTE: Estimated insert size may differ from sequence length (see http://www hgsc.bcm.unc.edu/docs/Genbank_draft_data.html).
NOTE: This is a working draft' sequence. It currently consists of 55 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

/codon.start=1
(http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with cenes with experient are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by KINAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1. .93859

This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                       consists of 23 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100 bp or 146393; contig of 25505 bp in length.
